

Installation Manual IDASmio R5 Filters

Notes before the purchase and installation:

- 1) The IDASmio R5 Filter can be attached to and detached from Canon EOS R5 cameras (can NOT be used with EOS R or RP).
- 2) This filter can NOT be used with any lens of which rear part is any farther extruded than the electrical contacts.

An example of an incompatible lens:

- 3) The optical path length change of this filter is ca.0.86mm.
- 4) When this filter is used between the lens and the camera, the back focus (BF) of the lens optically extends by about 0.86mm while the camera flange back (FB) relatively reduces by ca. 0.86mm.
- 5) When used with a camera that has not been modified to accommodate the abovementioned flange back change, you can still fine focus on celestial objects, but the lens cannot be placed in the position originally designed for infinity shooting. As a result, the astigmatism and field curvature may change, possibly causing shot images to deteriorate.

Installation to the camera:

First, hold the R5 Filter so the crescent part of the R5 mates with the dented portion of the body mount. Then, slowly mate the rest part of the R5 with the dented portion.

When to remove, touch the cut-away portion of the R5 with your finger nail, and slowly and gently pull it out.
